

FUN FACTS

At 600,000 pounds each, the reactor vessels for Plant Vogtle units 3 & 4 weigh more than the Statue of Liberty.

The 546,800 feet of piping required for Vogtle units 3 & 4 is enough to completely encircle I-285 around Atlanta three times – about 103 miles.

The on-site module assembly building, which is over 10 stories tall and as long as a football field, is large enough to contain 1,620 school buses.

Upon completion of units 3 & 4, the Vogtle site will generate more electricity than any other U.S. nuclear facility.

The 23,000 tons of structural steel required for the new units is enough to build 25,000 automobiles.

Vogtle units 1, 2, 3, and 4 will power more than 1 million homes and businesses once units 3 & 4 are completed. By 2030, electrical demand is projected to increase by more than 27 percent in the Southeast.

The carbon-free energy that will be produced by Vogtle units 3 & 4 is equivalent to removing more than 1 million cars from the roads each year.
